WHAT IS CLAIMED IS:

10

15

1. A scanning optical apparatus comprising:

incident optical means for causing at least one light beam emitted from light source means to be incident on deflection means; and

image formation means including at least one refractive optical element and at least one diffraction optical element for imaging said at least one light beam reflected and deflected by the deflection means on a surface to be scanned,

wherein the diffraction optical element has at least one of an incident surface having a convex shape in a sub-scanning cross-section facing the deflection means and an exit surface having a convex shape in the sub-scanning cross-section facing the surface to be scanned.

- An apparatus according to Claim 1,
 wherein a diffraction grating is formed on one
 of the incident surface and the exit surface of said diffraction optical element.
- 3. An apparatus according to Claim 1
 wherein said image formation means comprises a
 25 single refractive optical element and a single
 diffraction optical element and satisfies:

0.5<|e2/s1|

where e2 is a distance between an exit surface of the refractive optical element on an optical axis and the incident surface of the diffraction optical element on the optical axis, and

s1 is a distance between the incident surface of the diffraction optical element on the optical axis and a front focus position of the diffraction optical element in the sub-scanning cross-section.

4. An apparatus according to Claim 1,
wherein the refractive optical element has a
meniscus shape in a main scanning cross-section such
that a concave surface faces the deflection means.

5. An apparatus according to Claim 1,
wherein a front focus position of the
diffraction optical element in the sub-scanning crosssection is provided between a power arrangement in the
sub-scanning cross-section of an on-axis refractive
optical element and a power arrangement in the subscanning cross-section of an off-axis refractive
optical element, in an optical axis direction.

6. An apparatus according to Claim 1 further comprising:

at least one of tilt adjusting means and shift adjusting means for adjusting a position of said

diffraction optical element.

5

10

20

- 7. An image forming apparatus comprising: a scanning optical apparatus according to any one of Claims 1 to 6;
- a photosensitive member arranged on the surface to be scanned;
- a developing member for developing an electrostatic latent image formed on the photosensitive member by the light beam scanned by said scanning optical apparatus as a toner image;
 - a transfer member for transferring the developed toner image onto a material to be transferred;
- a fixing member for fixing the transferred toner image on the material to be transferred; and
 - a printer controller for converting code data inputted from an external device into an image signal and inputs the image signal into said scanning optical apparatus.
 - 8. An image forming apparatus comprising:
 - a plurality of scanning optical apparatuses according to any one of Claims 1 to 6,
- wherein a color image is formed by guiding a plurality of light beams emitted from the respective scanning optical apparatuses onto a plurality of

corresponding image bearing member surfaces, respectively, and scanning the plurality of image bearing member surfaces with the plurality of light beams.

5

20

25

9. A scanning optical apparatus comprising:

incident optical means for causing at least one light beam emitted from light source means to be incident on deflection means; and

image formation means including at least one refractive optical element and at least one diffraction optical element for imaging said at least one light beam reflected and deflected by the deflection means on a surface to be scanned,

wherein the following condition is satisfied: 0.5 < |e2/s1| < 1.2

where e2 represents a distance between an exit surface of the refractive optical element on an optical axis and an incident surface of the diffraction optical element on the optical axis, and

sl represents a distance between the incident surface of the diffraction optical element on the optical axis and a front focus position of the diffraction optical element in a sub-scanning cross-section.

10. An apparatus according to Claim 9,

wherein the diffraction optical element has at least one of an incident surface having a convex shape in a sub-scanning cross-section facing the deflection means and an exit surface having a convex shape in the sub-scanning cross-section facing the surface to be scanned.

11. An apparatus according to Claim 9, wherein a diffraction grating is formed on one 10 of the incident surface and the exit surface of said diffraction optical element.

5

- 12. An apparatus according to Claim 9,
 wherein the refractive optical element has a

 15 meniscus shape in a main scanning cross-section such
 that a concave surface faces the deflection means.
- wherein the front focus position of the
 diffraction optical element in the sub-scanning crosssection is provided between a power arrangement in the
 sub-scanning cross-section of an on-axis refractive
 optical element and a power arrangement in the subscanning cross-section of an off-axis refractive
 optical element, in an optical axis direction.
 - 14. An apparatus according to Claim 9 further

comprising:

at least one of tilt adjusting means and shift adjusting means for adjusting a position of said diffraction optical element.

5

20

15. An apparatus according to Claim 9, wherein the following condition is satisfied:

0.55 < |e2/s1| < 1.1

10 16. An image forming apparatus comprising:

a scanning optical apparatus according to any one of Claims 9 to 15;

a photosensitive member arranged on the surface to be scanned;

a developing member for developing an electrostatic latent image formed on the photosensitive member by the light beam scanned by said scanning optical apparatus as a toner image;

a transfer member for transferring the developed toner image onto a material to be transferred:

a fixing member that fixes the transferred toner image on the material to be transferred; and

a printer controller for converting code data

25 inputted from an external device into an image signal
and inputs the image signal into said scanning optical
apparatus.

17. An image forming apparatus comprising:
a plurality of scanning optical apparatuses
according to any one of Claims 9 to 15;

wherein a color image is formed by guiding a

5 plurality of light beams emitted from the respective
scanning optical apparatuses onto a plurality of
corresponding image bearing member surfaces,
respectively, and scanning the plurality of image
bearing member surfaces with the plurality of light
10 beams.
